ABSTRACT: This article provides detailed information on what the purpose of education is and what methods and ways to achieve success in education.

KEYWORDS: Education, ambition, success, perseverance, desire, determination, resilience, success factors.

Education is a lifelong personal journey!

Education is one of the most important processes affecting the lives of all people from birth. People, consciously or unconsciously, are constantly exposed to the act of learning. Just as air does not appear to cover all the space around us, so learning involves every moment of our lives; but often overlooked. When this learning process is implemented and focused on goals, people will have the opportunity to achieve great success.

So how does this happen? First of all, a goal for education should be set so that learning activities can be focused on that goal. Then "What is the purpose of education?" or "What should it be?" the question arises.

Just as a healthy life is necessary for everyone, a healthy and balanced education is necessary for everyone. At this point, everyone should set a goal. This goal should be to make him a healthy, peaceful and happy person. Education is to identify the potential that exists in a person and make it a reality by revealing it.

As F. Bacon said; A slow runner on the road always defeats a lost fast runner.

To be successful, it is absolutely necessary to set a clear and unambiguous goal, believe in it, and adjust your programs to that end. It is not enough for a person who has not clearly defined his goal to think about it. Those who achieve their goals are those who believe in their goals, fight for their goals and fulfill their demands.

In other words, the person must be self-motivated. Wanting to learn is an interest in the subject. Perseverance is a determined decision to learn. Therefore, if a student wants to succeed, he must want to learn with all his heart. Desire is the emotional aspect of achievement.

Studies have shown that successful people have the following characteristics:

- The ability to be active in the learning process,
- The feature of being a participant in the learning environment,
- Ability to know how to access information,
- Self-motivation feature,
- the ability to consciously protect one's own health,
- Time management feature,
- Goal setting feature,
- Ability to remain silent depending on the location,
- supporting feature,
- The ability to search from within, not external causes

So, if we want to be successful, we need to have these qualities and make the necessary efforts to achieve the goal with these qualities.

Factors of the success

The first factor is the quality of the teachers. The quality of teachers stands out as the most important factor influencing a student's level of education and coming from the school. It emphasizes the need to manage "quality" from end to end. In other words, the "quality of a teacher" in education includes encouraging talented people to become teachers, retaining them in the profession, providing opportunities for development and performance management.

The second decisive factor in educational success is the teaching methodology. This second factor indicates the need for a good system. In other words, the goals in the field of education need to be clearly stated, whether it is a student-centered education or a teacher-centered education system, and which subjects can be taught most effectively.

The third factor is equality. Accordingly, for a country to succeed in education, it must set clear indicators and goals that will ensure that all children, regardless of their gender and economic circumstances, have access to the system. In other words, systems that focus on improving the quality of education across the country, rather than on a single group or geographic location, will be more successful.

The fourth factor is social participation. Countries where education is respected by society are successful in creating highly effective education systems. In addition, the involvement of parents in the education of their children and in the decision-making processes of schools makes a difference in the system.

The fifth factor is to digitize all four factors as a factor that makes them better than one. It is noted that digitization opens the door to new opportunities, both as data collection and management, and as innovative tools for teaching, evaluation and forecasting. According to the report, countries that have been successful in education differ in at least one of these factors. So you don't have to be the best at all of these elements. By focusing on one or two factors, it can create successful systems within many other metrics. For example, when a country says, "We want the best quality teachers and we want to spread it all over the country," it is approaching success in other areas.

So it is very important to want to be successful. Desire is half the job, but the other half is hard work. It is necessary to create a work schedule based on learning and execution, not just to get a passing grade.
